AAW20042 shows human decorsin, a platelet aggregation inhibitor, flanked by residues of surrounding linker peptides. The sequence is the product con a rayression cassette that was incorporated into a larger DNA cassette as an N-terminal functional domain. The larger cassette comprises, in 5' to 3' direction, a 1st functional domain; a 1st linker sequence; a multimerisation device; a 2nd linker sequence; and a 2nd cfunctional domain. The multimerisation device allows the combination of two or more functional domains in a structure which is capable of self-two or more functional domains in a structure which is capable of self-two or more functional domains in a structure which is capable of self-two or more functional domains from far a structure which is capable of self-two or more functional domains from p53, platelet factor 4, thrombospondin, TSP-4, TATA box binding associated factors and cartilage oligomeric protein may be used. The multifunctional proteins can be prepared using standard recombinant micro-organisms, even though the molecular weight of the assembled protein exceeds that of the proteins can molecular weight of the assembled protein micro-organisms, even though the molecular weight of the assembled protein micro-organisms, even though the molecular weight of the assembled protein may be used in vitro synthesis overcomes prior art problems due to the differences in folding, secretion and post-translational moultimeric modifications to the different polypeptides in different hosts
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Thrombin; factor Xa; cleavage site; receptor; GPIIbIIIa; blood; clotting; infarction; stroke; platelet aggregation; leech.
                                                                                                                                                                                                                                             Multimerisation devices for self assembly of multifunctional proteins - used to express recombinant multivalent poly:peptide(s) by incorporation

This cleavage site is used to generate decorsin from a fusion protein (constructed e.g. for secretion into the periplasmic space or for intracellular expression). A peptide at indicated peptide 2 is functional as inhibitor of platelet aggregation. The prod. binds to the GPIIDIIA receptors so prevent binding of fibrinogen to platelets. It can be administered therapeutically (esp. to fibrinogen to platelets. It can be administered therapeutically (esp. to provide a concn. of InM-SO microM) to prevent abnormal blood clotting (e.g. in phlebicis, infarction, stroke, etc.), opt. together with a fibrinolytic agent). See also AAQ13324-26, AAR13676-78, AAR13672-74 and

The invention relates to an isolated gene encoding apoptic protease, mammalian ced-3 homologue 6 (Wch6). Mch6 is a member of the aspareate-specific oysteine protease (ASCP) family. Wch6 DNA and protein sequences are useful for modulating apoptosis for the therapeutic treatment of human diseases. Mch6 sequences are useful for upregulating apoptosis of e.g. for treating lafections) or downregulating apoptosis (e.g. for treating Jazheimer's disease, parkinson's disease or cerebellar degeneration). The Mch6 sequence is useful for disgnosing, treating or reducing the severity of cell deathmediated diseases, as well as other diseases mediated by either increased or decreased programmed cell death. The present amino acid sequence is ICH-1 peptide which belongs to NEDD-like ASCP subfamily
                                                                                                                                                      New apoptotic genes and their apoptotic protease products, useful for modulating apoptosis for the therapeutic treatment of human diseases, e.g. cancers, autoimmune disease, Alzheimer's disease or Parkinson's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ;

A; Title: Identification of the SV40 agnogene product: a DNA binding protein.
A; Reference number: A33257; MUID:81197675; PMID:6262654
A; Contents: annotation; identification of the protein
C; Comment: This protein, encoded by the agnogene, is also called agnoprotein. It may have; C; Superfamily: polyomavirus DNA-binding protein
C; Keywords: DNA binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A;Accession: B36762

KTOL B.A., Soberon M., Yurgel S.N., Miranda Rios J., Simarov B.V.;

Submitted (MAY-1999) to the EMBL/GenBank/DBBJ databases.

-!- FUNCTION: Part of a binding-protein-dependent transport system.

Probably responsible for the translocation of the substrate across the membrane (By similarity).

-!- SUBCELLULAR LOCATION: Integral membrane protein (By similarity).

-!- SIMILARITY: Belongs to the binding-protein-dependent transport

System permease family.

-i- CATALYTIC ACTIVITY: 4 porphobilinogen + H(2)0 = hydroxymethylbilane + 4 HH(3).
-i- COFACTOR: Covalently binds a dipyrromethane cofactor to which the porphobilinogen subunits are added (By similarity).
-i- PATHWAY: Porphyrin biosynthesis by the C5 pathway; fourth step.
-i- SUBUNIT: Monomer (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                 QBPR3;

--- COFACTOR: Covalently binds a dipyrromethane cofactor to which the porphobilinogen subunits are added (By similarity).
--- SUBUNIT: Monomer (By similarity).
--- SUBUNIT: Belongs to the HMBS family.
                                                                                                                                                     Gaps

```
Fixing endosymbiont Sinorhizobium meliloti.";

Proc. Natl. Acad. Sci. U.S.A. 98:9889-9894(2001).

1- FUNCTION: Part of a blinding-protein-dependent transport system.

Probably responsible for the translocation of the substrate across the membrane (By similarity).

1- SUBCELLULAR LOCATION: Integral membrane protein (By similarity).

1- SIMILARITY: Belongs to the binding-protein-dependent transport system permease family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nature 413:852-856(2001).

-!- CATALYTIC ACTIVITY: Nicotinate D-ribonucleotide + diphosphate nicotinate + 5-phospho-alpha-D-ribose I-diphosphate.
-!- PATHWAY: Nab biosynthesis; nicotinamide to NaMN; second step.
-!- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
-!- SIMILARITY: Belongs to the NAPRTase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Name=pncB; OrderedLocusNames=STM1004;
